

AbleSpace - Take Data Workflow & Product Analysis

Technical Assessment - Part 2 | Hands-on workflow review

This document explains the AbleSpace Take Data workflow based on direct hands-on exploration. It describes how a provider moves from a student in Caseload to goal-specific session capture, how the information is stored and reviewed, and where the experience could be improved.

Primary user goal	Core path	Key behavior
Capture measurable student performance during a live session.	Caseload -> Student -> Take Data -> Goal -> Capture -> Review.	Session entries auto-save and appear in historical data.

Executive Summary

Take Data is the operational workflow used to record a student's performance against specific goals and objectives. A provider selects a student, opens Take Data, chooses a goal, records goal-specific measurements, and AbleSpace stores the observations automatically. The captured information can then be reviewed through historical Data, Overview, Graphs and Stats, and can be combined with attendance, service-time and reporting workflows.

Key product insight

The capture interface changes with the measurement type. Task-analysis goals present individual tasks, while accuracy-based goals use attempts, prompts and calculated percentages.

1. End-to-End Workflow

The hands-on flow observed during testing was:

1	2	3	4	5	6	7
Caseload	Select Student	Take Data	Select Goal	Capture	Auto-save	Review / Report

Step 1 - Access Caseload and select a student

The workflow starts in Caseload. The provider selects a student and uses Take Data, opening a session linked to the student and its available goals.

Step 2 - Select a goal/objective

The goal list stays visible during the session. Selecting a goal changes the right-side capture area to the measurement configured for that goal.

Figure 1. Writing goal captured using Task Analysis. Individual tasks (D, E, M and O) are marked during the session.

2. Measurement-Specific Capture and Automatic Saving

Take Data is not a generic form. The capture controls adapt to the goal's measurement type, allowing different kinds of performance to be recorded within one consistent session workflow.

Accuracy / prompted example

For the Math goal, the screen tracks attempts, correct/incorrect responses, prompts, prompted percentage and overall accuracy. The result updates while the provider records the trial.

The screenshot shows the AbleSpace interface during a data capture session. On the left is a dark sidebar with navigation icons and labels: CAPTURE (Calendar, Caseload, Data, Accommodations, Service Time) and TRACK (Report, Attendance, Goals). The main area has a top header with a back arrow, date/time (08/20/2026, 06:35 AM - 07:05 AM), a 'Saving...' indicator, and buttons for 'Accommodations' and 'Services Not Tracked'. Below this is a student selection bar with 'DS Demo Student1' and an 'Add Student' button. The main content area is divided into two panels. The left panel, titled 'Goals (7/7)', lists several goals for 'Demo Student1', including '3.1. Demo Student1 will be at...', '3.2. Demo Student1 will be at...', '4. Reading Demo Student1 will answer "Wh"...', and '5. Toileting Demo Student1 will complete all...'. The right panel, titled 'Capture', shows details for a 'Math' goal: 'Demo Student1 will be at 70% proficiency at the 1st-grade level as measured by the MFF-1D assessment'. It features a large display showing 'Prompted 66.7%' and 'Accuracy 66.7%'. Below this are buttons for '+', '-', and 'P'. At the bottom, it shows '6 Attempts' with a counter of 4, and '0 Prompts' with a counter of 0.

Figure 2. Accuracy-based Math capture showing attempts, prompts and calculated accuracy. A “Saving...” state is visible at the top.

Observed saving behavior

No separate Save Data action was required during testing. Entries were stored automatically and appeared in the review screens immediately afterward.

3. Historical Data and Performance Review

After capture, the provider can review the selected goal through View Data. The screen presents the measurement method, last update date, number of data points, notes count, goal description and a performance summary.

Figure 3. View Data for the Writing goal showing Task Analysis, latest update, two data points and an 87.50% overall average.

Graphs, Stats and Progress Notes are available from the same view, connecting individual session observations to longer-term progress monitoring.

4. Central Data History

The Data screen consolidates recorded observations by session, student and goal/objective. During testing, newly captured values appeared shortly after the Take Data interaction, confirming that session capture feeds the historical record without a manual Save step.

The screenshot shows the 'Data' screen in the AbleSpace application. On the left is a dark sidebar with navigation options: CAPTURE (Calendar, Caseload, Data, Accommodations, Service Time) and TRACK (Report, Billing, Collaborators). The 'Data' option is selected. The main area has a header with 'Data', a filter icon, a date selector set to 'Today', and a '+ Log Data' button. Below the header is a table with columns: Session, Student Name, Goal/Objective, Data, Notes, Measur..., and M.. The table contains three rows of data for a session on 08/20/2026 at 06:16 AM. The first row shows '2. Writing' with data 'D, E, M'. The second row shows '3. Math' with data '100.0% (100.0% Prompted)'. The third row shows '2. Writing' with data 'D, E, M, O'. Each row has a checkbox in the Session column and a 'Measur...' column with a calendar icon.

Session	Student Name	Goal/Objective	Data	Notes	Measur...	M..
☐ 08/20/2026 06:16 AM New Session Updated: 1 minute ago	DS Demo stu...	2. Writing Demo Student1 will wri	D, E, M	—		⋮
	DS Demo stu...	3. Math Demo Student1 will be	100.0% (100.0% Prompted)	—		
	DS Demo stu...	2. Writing Demo Student1 will wri	D, E, M, O	—		

Figure 4. Session history showing the student, goal/objective and data values captured during the tested session.

Data lifecycle

Student goal -> session measurement -> automatic persistence -> historical Data / Overview -> reporting and progress review.

5. Attendance, Service Time and Reporting

Session data sits alongside attendance and service tracking. These fields provide operational context for the session and can be used in downstream reports.

Service Time: student, attendance and a 30-minute service-time field.

Attendance Report: student context and Generate Report action.

A previous session displayed “Not Tracked” for attendance/service context. This shows the workflow supports those fields, but also highlights the risk that goal data can be captured while session metadata remains incomplete.

6. What Works Well

- Goal-centered workflow keeps data collection tied to a measurable student objective.
- Measurement-aware capture adapts to Task Analysis, accuracy/prompts and other goal types.
- Automatic saving reduces interruption during live data entry.
- Captured values appear in Data and View Data shortly afterward, creating strong historical continuity.
- Overview, Graphs, Stats and Progress Notes provide multiple ways to review progress.
- Attendance, service time and report generation extend the workflow beyond raw goal measurement.

7. UX/UI and Functionality Improvements

1. Stronger autosave confirmation	Follow “Saving...” with a clear “Saved” state or last-saved timestamp so users know the latest observation is secure.
2. Better loading feedback	Some screens took noticeably longer to load. Skeleton states and clearer progress feedback would reduce uncertainty.
3. Session-start checklist	Surface student, time, attendance and service tracking as a compact checklist so the provider knows what is still incomplete.
4. Incomplete-session warning	Warn when leaving if attendance or service time is untracked, without blocking already auto-saved goal data.
5. End-of-session summary	Show goals updated, attendance status, service time and last saved time before the provider exits the session.

8. Conclusion

The Take Data workflow connects real-time session capture with measurable student goals, historical progress and reporting. Its strongest product decision is the measurement-specific capture experience: providers can collect different kinds of evidence without leaving the same overall workflow.

The main opportunities are around confidence and completion rather than core capability. Clearer save confirmation, stronger session-completion guidance and smoother loading feedback would make the experience easier to trust during frequent live use.

Workflow in one line

Caseload -> Student -> Take Data -> Goal -> Session capture -> Auto-save -> Historical review -> Attendance/service context -> Reporting.

Scope of this review

This analysis intentionally focuses on the Take Data workflow requested in the assessment. Other AbleSpace areas were explored only for context and are not part of this submission.
